ENDORSEMENT

This thesis proposal entitled "**WEB BASED HOTEL MANAGEMENT SYSTEM A PROPOSED ONLINE SYSTEM WITH SHORT MESSAGING NOTIFICATION**"

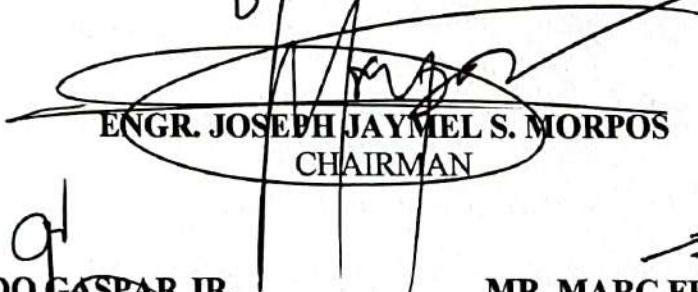

prepared and submitted by, Rovic D. Jonale, Mary Joy R. Pepito, John Niño Peñalosa in partial fulfillment of the degree of **Bachelor of Science in Information Technology** is hereby accepted and recommended for Oral Defense.

MRS. FRANCES CLAIRE F. JARITO
ADVISER

Evaluation Panels' Approval Sheet

APPROVED by the members of the evaluating panel in an Oral Defense with the mark of **PASSED**.

ENGR. JOSEPH JAYMEL S. MORPOS
CHAIRMAN

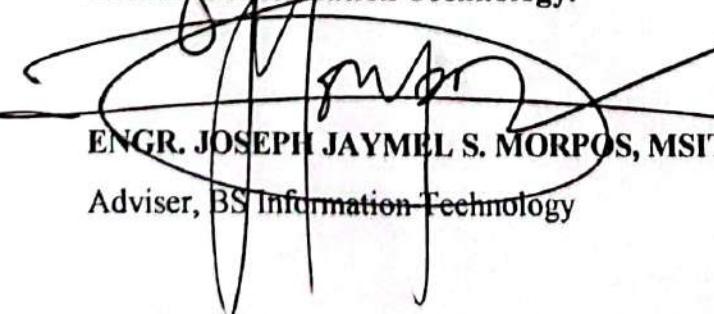

MR. ROLANDO GASPAR JR.
MEMBER

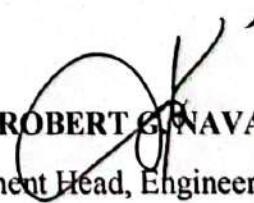

MR. MARC FRITZ ASEO
MEMBER

MR. WILFRED JUDE A. PERANTE, MSIT
MEMBER

ACCEPTED as a partial fulfillment of the requirement for the degree of, Bachelor of Science in Information Technology.

ENGR. JOSEPH JAYMEL S. MORPOS, MSIT
Adviser, BS Information Technology

ENGR. ROBERT G. NAVARRO
Department Head, Engineering

ACKNOWLEDGEMENT

The achievement of making this thesis is a best experience for us. It teach us how to be responsible and hardworking in doing our obligation as a students. We would like to thanks God for giving us the strength in facing all the challenge, the guidance that we are able to pursue this study and to make it possible, and all the knowledge in exploring things.

Thanks be to God for giving us the following persons who serve us instruments to overcome this study and give us inspirations to fight for our dreams.

To our parents, for giving their support and encouragement to pursue this study, for sacrificing their happiness to let us be in school, for giving us their unconditional love and time, and for the effort for being a responsible parents to their children's.

Mrs. Frances Claire F. Jarito, for being our over supportive adviser. For sharing your knowledge to come up with this study, for your effort and support to let this study be done with success. For giving us wonderful advices, teach us to work us a team. For giving the love and importance of friendship more than being a technical adviser. Above all, thank you for your patience and acceptance.

Mr. Joseph Jaymel S. Morpos, for sharing his overall knowledge for the concept of this thesis. He has always been the motivator to do more and reminds us not limit ourselves on the things we already know. He always tell us that we can do it, if we work for it.

The panel member namely, Mr. Wilferd Jude A. Perante, Mr. Rolando R. Gaspar Jr. and Mr. Marc Fritz Aseo, for their sharing their ideas for the success of this thesis.

Mr. Ernesto Enage III for giving his time in checking our manuscript.

To front desk in Villa Hotel, who patiently lent her time during we conducted a private interview, and to her patient in discussing the necessary inputs for this study.

To all our families, friends and love ones who serve us inspiration in doing this study. For the overall love and support, and for understanding. Thank you.

"God Bless"

Jonale, Rovic D.

Pepito, Mary Joy R.

Peñalosa, John Niño

ABSTRACT

The establishments today are into fast, secure system are at average with world today. If there are more establishment still in manual way, there are still problems on it and it is behind of the advancement on what technology is today. Information Technology is very much in demand in our country. Implementation of it will surely benefit in all establishment not just for working procedures but also for fasten operation.

There are some hotel management in our country using manual process in performing their daily task, and it gives them hassle interactions between the staff and guest, before hotel are using manual process it utilizes non-technological tools. The records of the costumers that are entering inside their hotel are manually recorded to their files.

Therefore the proponents are helping the said establishment by proposing a Web Based Hotel Management System a Proposed Online System with Short Messaging Notification. Through this system all of the hotel management will be given a secure, fast and efficient system in doing their daily task.

Chapter 1

INTRODUCTION

The innovation brought by technology today is an essential part of our lives. We achieved a lot with the help of technology, to keep in touch with friends on the other sides of the earth. Technology shapes the future and it can help to make it compatible with nature. With that, a new and better software will develop when time comes. Using the technology it helps the persons perform in many task easier without hassle. Technology is not only about technology itself or more efficiency and discovering new methods and processes.

The technology's role in our country to teach people to adapt the modernization of technology and to explore how technology has been used to enhance human abilities. The advent of this technology had given rise to easy and hassle-free interactions between and among clients or guest. Technology is helpful because it allows people to perform their daily jobs or tasks at a faster rate.

In this proposal, we will introduce a Web-Based Hotel Management Reservation and Monitoring System and Online System with Short Messaging Service Notification. It is a system that will enhance and fasten the services that will be provided in the hotels daily task and for the hotel guest as well. It is an ideal software solution for hospitality industry that can be used for convenience speed. Therefore, the overall efficiency of the hotel staff and the management system is increased.

a. **Background of the Study**

A Hotel is an establishment providing check-ins, meals and other guest services. There are many categories of hotels in our country, the hotel barges, caravanserais, condo hotels, heritage hotels, luxury hotel, motels, and resort hotel. There are more accommodations offers in this different hotels.

Hotel barge came into following the decline in commercial and freight carriage on the canals of Europe. Its offer bed and breakfast, lunch, full board and self-catering. The heritage hotel is an older historic building that has been converted into a luxurious hotel. The hotels try to treat their guests like they are royalty. It offers polished rooms and suites, plus cafe and an outdoor pool. The luxury hotel is a hotel that is upscale and typically costs more than the average accommodation. It is also provides lot of different types of accommodation.

A motel is a road hotel designed primarily for motorists, typically having the rooms arranged in a low building with parking directly outside. A resort hotel is a luxury facility that is intended primarily for vacationers and usually located near special attractions such as beaches and seashores, it offers meals rooms and other services for the costumer.

The hotel before are using manual process it utilizes non-technological tools, which include paper, and writing utensils like log book the records of the costumers that are entering inside their hotel and manually recorded to their files. They are trying to manage manually the process of services on their customers.

The modern hotel are using computerized system that stores and distributes the information of a hotel, resort or other lodging facilities. The system is a tool to reach the global distribution system as well as internet distribution systems from one single system.

The system of the business today has many innovations and advancements, one of the example is the computerization. We cannot deny that we are now in much more technologically improvement and especially for business, shifting from manual process to automation and computerize. Hotels consisting this kind of business requires lots of investment and proper usage of assets and resources and to back it up of business hotel management system will surely aid on its success.

It's important for a hotel to understand the needs of their guest, the things that guest demands for most, what food material get used least and result in lost because a good hotel management allows hotel to do just that. In addition, we should also include what hotel services offered, in order to fully understand the proposed system that is to be developed.

b. Statement of the Problem

The hotel management has a manual process in room's reservation and hotel management transactions. These are some specific problems being encountered of the hotel management:

- How to offer exact and consistent reservation to the customer.
- How to help each department inside the hotel management to improve their services.
- How to provide qualified information about the availability of rooms.
- How to provide constant information given after customer's reservation.
- How to provide security to avoid unauthorized accessing the records of guest.
- How to provide a fast and easy retrieval of guest records.

c. ***Objective of the Study***

The project aims to create a “Hotel Management Reservation and Monitoring System and Online System with SMS Notification” for the customers reservation and for the hotel management.

- To provide accurate reliable reservation.
- To easily manage the different transaction of the hotel department.
- To provide excellent comparative information about available hotel rooms.
- To provide an SMS notification services to the customers who have reserved online.
- To enforce security actions to avoid unauthorized access to guest records.
- To offer user interface inside the guest room which guest can easily request.

d. Significance of the Study

The proposed system will benefit the following: first the hotel management, front desk, hotel manager, administrator, concierges, housekeeping, accounting, human resource and customer/guest. The proposed web-based hotel management reservation and monitoring system and online system with short messaging service notification will contribute a great part in terms of the hotel facilities and services.

The hotel management which has been using manual management of their services should enhance and evolve their ways in terms of managing the hotel services and other particular task. It is the one who will be beneficiary of the system. It would be able to provide efficient, faster and hassle-free assistance to the customer or clients who want to check-ins in the hotel.

Front Desk is the main desk at a hotel for checking in or out and handling request from guest, it will be much easier to find particular record rather than opening such huge files and finding a single or specific record out of it. The system will make their work faster and this will help them do more jobs in lesser time to be served the customers.

Human Resource is the in larger organizations have employees who are organized around providing a specific component of services, it will help them to make their work faster and other services inside the human resource department.

Accounting is the one who benefit in terms of handling a variety of important task such as easily preparing the financial statements of the hotel management by the use of automated system.

Hotel Manager is the responsible for the day-to-day management of a hotel by just monitoring their employees using the computerized system. It will help them manage the operation of a hotel as faster as they can anytime. It will be easy for them in terms of planning, coordinating and administering hotel services.

Administrator is one that will benefit in terms of accessing all the files on the computer, and make update in all the changes regarding of rate and services offered in the hotel management.

Concierges is the one can easily contact by just a simple click and it will coordinate the executive of this service with less time being consumed. They'll be able to conveniently do their work using the automated system. It will be much easier for them to serve their guest.

Housekeeping is one that will benefit in terms of leadership of people, equipment and supplies needed in the each hotel rooms and servicing the guest rooms and public areas faster by just using the automated system assigned on the housekeeping department.

Customer/Guest who wants to check-in in the hotel and inquire for its services will be easily guided by just using the online reservation system anywhere, through the proposed system it would be easier and faster for them using the system provided.

e. Scope and Limitations of the Study

The coverage of the proposed system is focused of the web-based hotel management system and include the online reservation system, monitoring and SMS notification. Through online reservation system, the company must have their own website with a user friendly interface wherein customers can easily book a room or plan an event through online giving them a more easy way and hassle free reservation.

In terms of security, the proposed system will include a log-in form. The authorized user will have a unique username and password, at least (6-12) characters long. If ever the authorized user exceeded the number of times in entering the invalid password, forgot password which will generate a new password and send an email containing their log-in details to the registered email address on their account.

As for reservation online, guest must be input the date of check in and check out to make reservation in order to view the room availability. The guest can also select the room they wanted to reserve and overview the room types, room rates and other services offered on the hotel.

When reserving for a room the guest must fill-up a form provided within the site like personal details of the guest including full name, address, contact number, email, and the customer must also indicate the date of the reservation, the date and time of check-in and date and time of possible check-out.

The guest can view the amount they need to pay through online depending on the rate of rooms and the days of stay in the hotel, after reservation transaction of the

customers online, a notification message will be sent on the customers email and phone number, allowing customers receive a text message confirming that the reservation is successfully made.

The reservation online will be seen by the assign department which is the front desk. The notification will include the details about the reservation regarding the guest information, types of room they have been reserved and the total amount of the bill the need to pay, regarding on the payment the guest can only pay the payment during their arrival inside the hotel.

The front desk give the guest code number upon check in regarding on the guest account inside the room, which guest provided a user interface in the case of requesting in housekeeping, maintenance and food and beverage.

The cashier inside the hotel management is responsible to collect the payment of the customer; there would be assigned user account for the cashier and user interface to make the job easily performed. The guest must arrive ahead of the check in time,

The administrator can delete, update and add new offers to their system. The administrator also is the one who can view the online reservation and walk in transactions. Human Resource department is the one who can add account and update the users account in each department inside the hotel.

Accounting department is the assign user who manage the reports and sales of the hotel, the food and beverage department has its own cashier. If ever the guest ask some foods the food and beverage is the one assign for the service. All departments inside the

hotel will be provided a user friendly interface that helps them to perform faster on their daily transactions.

The proposed system has its limitations. Changing reservation is not allowed once transaction is done, cancelation on reservation can be cancelled 3 days after before check in. The client can only reserve the room and packages display in the website, Asking for any add-ons must be done directly upon check in. A valid debit or credit cards is required to secure reservation. The authorized user of the account in each department has its own differences and limitation regarding on its function. The administrator can only update or add room but cannot delete room. The guest has its own interface inside the room which they can request in a specific department inside the hotel and has its limits depending on the services available, payment for guest additional request must pay on the cashier and charge before check out.

f. Definition of Terms

The following words are operationally defined to enable the readers to a better understanding and more comprehensive of the study:

Hotel Management is refers to professional management techniques used in the hospitality sector. The can include hotel administration, accounts, marketing, housekeeping, front office or front of house, food and beverage management, catering and maintenance.

Service is the action of helping or doing work for someone. A set of matching dishes and utensils used for serving a particular meal to the costumer.

Reservation is an arrangement to have something held for your use at a later of time it is also a feeling of doubt or uncertainty about something.

Monitoring means to be aware of the state of a system, to observe a situation for any changes which may occur over time. It is also used to observe and check the progress or quality of something over a period of time or keep under systematic review.

Notification is a message you can display to the user outside of your applications and to see the details of information.

Information system is a combination of a set of components for collecting, storing, and processing data and for delivering information.

Internet is a global system of interconnected computer networks that use the internet protocol suite to link billions of devices worldwide.

SMS or (short messaging services) are a text messaging service component of phone, Web, or mobile communication systems. It uses standardized communications protocol to allow fixed line or mobile phone devices to exchange short text messages.

Web-based is a computer software application that is coded in a browser-supported the programming language and reliant on a common web browser.

Sublime text is a platform source code editor with a Python application programming interface. It natively supports many programming languages, and its functionality can be extended by users with plugins, typically community-built and maintained under free-software licenses.

Software is an untouchable entity and a written sequence of instructions, procedures or rules and associated documentation pertaining to the operation of a computer.

PHP which stands for Personal Home Page is an open source server-side scripting language designed for Web development to produce dynamic web pages.

Database is a collection of information that is organized so that it can easily be accessed, managed, and updated.

Online is the condition of being connected to a network of computers or other devices under computer control.

Computer is a thing or device created by human, which is powered by electricity and electronic device or a programmable machine for storing and processing data.

User-interface is a sequence of instructions that controls a display for the user (usually on a computer monitor) and that allows the user to interact with the system.

Chapter 2

METHODOLOGY

This chapter focus on the steps used concerning the development of the Hotel Management System. It includes the methods of research used. It also includes the different instruments in gathering data. The researchers applied a descriptive method of study and describe the characteristics of the variable of interest in situation. The researcher's goal to describe the relevant aspects of phenomena of interest from individual, organizational or other perspective. Describe systematically a situation, problem, phenomena, service or program.

Questionnaire: This instrument was used by the researcher because it is the most common ways in gathering information in a massive population the questionnaire was designed based from the statement of the problem.

Interview: This involved the collection of data through direct verbal interaction. It was used in the beginning of the study. The researcher conducted an interview with the faculties and stuff to gain information, ideas or opinion regarding from the asked question.

Internet Research: The researchers also used this research instrument to gather some related literatures and studies. It also helps the researcher gain tips and ideas in developing Hotel Management System.

Observe: This instrument are used to process of observing something in order to gain some information to fulfill in developing the system.

a. Review of Related Literature and Studies

A review of related literature and studies is the theories which the researchers use to explain the existence of a research problem and use as a basis in analyzing relationship between variables can be generated from reference books and of collecting, selecting and reading books, journals, reports, abstract and other reference materials. The sub-topic begins with the Introduction, Related Literature, Foreign Literature, Local Literature, Related Studies, Foreign Studies, Local Studies and the Synthesis and Significance of the Study.

Bituin Abi is Apartelle Online Reservation System is a short term base lodging is the main reason that a hotel has been established. In the Philippines, where in many foreign people visit and have a vacation, hotel is always their first destination to have relaxation after long hours of travel by airplane. Because of the rapid increase of foreigners visiting the Philippines for a vacation, a common sight is the establishments and sophisticated hotels for competitive advantage.

As the result of the competition between different hotels, various business strategies had been made to attract customers, such as putting discounts, having beautiful and relaxing environment and above all having a state of the art computer system and facilities. The current problem observed is the manual guest list records, the manual reservation of guests, the manual booking of rooms for the guests which takes a long time to accomplish. According to the manager in the establishment, because they keep on doing their job manually, it resulted to a very messy office, lots of papers around the desk and sometimes important documents disappear. From the information gathered, the proponents came up

with an idea of proposing a system that is relevant to the needs of the establishment, highly efficient to meet their needs and most of all simple, easy to use system.

Catalogue Horse21 is an online hotel catalogue in the Philippine. The Microtel Inn & Suites by Wyndham Manila/At Mall of Asia is strategically situated near SMX Convention Center, SM Mall of Asia and Ninoy Aquino International Airport. It is near major business districts and tourist destinations. It is easily accessible by private and public transport. The hotel has a restaurant serving international cuisine and function room for 200 persons. The swimming pool located at the roof deck will be operational soon. Free WIFI in Lobby, Restaurant Only. ₱100/hour for in-room internet use. Free buffet breakfast in all rooms. Hotel does not offer room only rate.

Microtel by Wyndham stand out from other properties because of the system-wide design of its buildings and furnishings that stress function, comfort, and convenience, while at the same time meeting international quality standards. The online system did not provide an instant booking system. Guest will have to wait for confirmation within 24 hours after have availability checks and instant confirmation of the booking. The purpose of this feature is to save valuable time and to cut cost, as it will eliminate email exchanges between guests and reservation department. Valuable reservations staff time is saved because reservation requests will no longer have to be processed. As conclusion, system will be developed to have an instant booking for the room and meals. There is a 'back office' for them to control the content of the portal. This is to help hotel in better management of their reservation and their official website.

Baybayon ni Agalon Hotel and Beach Resort is using online reservation system and manual services system to their customer it is located at Albuera Leyte it is one of the

tourist destination. The hotel has different kinds of room's namely De Luxe room's two beds for 4 person, family rooms for 6 person and dormitory room's for 30 person. There are 3 swimming pool inside the Hotel Beach Resort. There are two types of cottages the seaside cottages and the poolside cottages. They have their function hall that can be use in some events for the guest and clients. Inside the hotel they have their restaurant and bar. They have also two types of table garden the swing and umbrella types for two persons.

They are using online reservation especially for travelers from abroad who want to have vacation and to see the features of the resort. The customer are allowed to enter in the resort to just look around and see how the resort looks like for just 15 minutes, guest can also walk in and have a swim for just 85 peso only. And for the check in they can also stay for a night for a low price only based on the hotel room's prices. They are using manual system on this process by just filling up the information given by the staff through a manual login. The resort has 32 employees except for 15 intern's students.

LAN-Based Reservation System for Hacienda Gracia Resort and Hotel A resort is a place used for relaxation or recreation, where visitors are being attracted to take their holiday or vacation. It refers to places, towns or sometimes commercial establishments operated by a single company. On the other hand, a hotel is differentiated as an establishment that provides paid lodging on a short-term basis. Computer programmers are continuously developing a system application to better serve resort or hotel guests because some hotels and resorts are becoming fully automated while others are still striving for the similar setting. The researchers introduce a "LAN-Based Reservation with Billing System for Hacienda Gracia Resort and Hotel" to improve its reservation and billing system. The advent of new technology gave rise to easy and hassle-

free interaction between and among humans. This is why most hotel and resorts prefer to employ computerization in their business. As a conclusion, their system is a LAN-based system so we generate their system an online system for some to organize and developed system is appeared to be more attractive, efficient and dynamic.

Marco Polo Hotel (2013): Every hotel of the Marco Polo group is an embodiment of Asian warmth and Western comfort, a blend which conjures an unforgettable experience for every guest staying with us. Marco Polo hotels provide their guests with a unique travel experience which embraces the local charm and the adventure of travel with the deeply instilled elegance and warmth of the in-house culture of Marco Polo hotels. Every Marco Polo hotel befits the new-age traveler, whether on business or leisure, with its elegant design, impeccable service and modern comforts. Just like the continent we are based in – Asia, Marco Polo Hotels with its thirteen properties in key Asian business destinations has flourished and established itself as one of the leading hotel brands in the region. Anyway, the online system did not provide an instant booking system. Guests will have to wait for confirmation within 24 hours after their booking. To enhance the current system, system is developed to enables guest have availability checks and instant confirmation of the booking. The purpose of this feature is to save valuable time and to cut cost, as it will eliminate email exchanges between guests and reservation department. Valuable reservations staff time is saved because reservation requests will no longer have to be processed. Although the online system had included the picture for the bedroom, kitchen and dining room, visitors only can view of it. With a more advance feature provide in developed system, visitors will be able to view the whole room, for every angle of the room. The current online system for Marco Polo Hotel did not include the management for

housekeeping. In addition to enhance the functionality of developed system, a 'Housekeeping' features added for housekeeper to perform their daily work. As conclusion of this case study, system will be developed to have an instant booking for the room and meals. There is a 'back office' for them to control the content of the portal. This is to help hotel in better management of their reservation and content of portal. The 'Housekeeping' features also hope to provide staff have better management of daily work and able to work on schedule.

Shangri-La's Mactan Resort and Spa is a resort hotel owned by Shangri-La Hotels and Resorts located at the island of Mactan, Cebu. It was once the Philippines' largest resorts, equipped with 547 guest rooms and suites. The places available in virtual tour are lobby, rooms, function rooms, recreation, restaurant and bars. Visitors can use their computer mouse to navigate around the hotel. For business person usage, the website provides a form for guest to fill in their reservation details. In addition to room reservation, guests may fill in another form to make special request for their reservation.

The structure of this website is well organized and easy to navigate through. As conclusion, Shangri-La's Mactan Resort & Spa online reservation system is an efficient, powerful and robust online system. In order to enhance the current system, the system is developed to enables every visitors having their virtual tour on hotel.

housekeeping. In addition to enhance the functionality of developed system, a 'Housekeeping' features added for housekeeper to perform their daily work. As conclusion of this case study, system will be developed to have an instant booking for the room and meals. There is a 'back office' for them to control the content of the portal. This is to help hotel in better management of their reservation and content of portal. The 'Housekeeping' features also hope to provide staff have better management of daily work and able to work on schedule.

Shangri-La's Mactan Resort and Spa is a resort hotel owned by Shangri-La Hotels and Resorts located at the island of Mactan, Cebu. It was once the Philippines' largest resorts, equipped with 547 guest rooms and suites. The places available in virtual tour are lobby, rooms, function rooms, recreation, restaurant and bars. Visitors can use their computer mouse to navigate around the hotel. For business person usage, the website provides a form for guest to fill in their reservation details. In addition to room reservation, guests may fill in another form to make special request for their reservation.

The structure of this website is well organized and easy to navigate through. As conclusion, Shangri-La's Mactan Resort & Spa online reservation system is an efficient, powerful and robust online system. In order to enhance the current system, the system is developed to enables every visitors having their virtual tour on hotel.

b. Conceptual Framework

The conceptual framework is the foundation for developing the system. This shows how the proponents conceptualized the proposed system. The Input is the information, ideas, and resources used. Processing is an action taken upon/using input or stored material. Output a result of the processing and the exits system. This study makes use of the system's analysis of input, process, and output.

In the planning phase, problems of the current systems and of the system under study are recognized and provided solutions. In this phase the tools being used are a number of different articles that are related to the study. The assumption is, all data gathered are very helpful to the study because it will serve as information or guide towards the fulfillment of the study. The problem must be expressed in quantitative terms so that it will be easy to analyze and implement the possible solutions. The proponents will evaluate the results of the problems for optimization.

In the analysis phase, the proponents develop a solution for overcoming the weakness of the current system to achieve the researcher's goals. It is a detailed look of the system. All possible alternatives, which can help in developing a cost effective project are analyzed. This phase also identify and resolve all the possible risk in the project development. Design Phase is how the system will operate in terms of the hardware, software, and network infrastructure, the user interface, forms, reports and the specific programs, databases, and files that will be needed.

Implementation phase is the conversion of old system into the new format of the proposed system. The implementation of hardware and the relevant software are required

in order for the system to run. They must be operational before implementation. When the software is coded, integrated and tested.

Reviewing is one way to have ideas for the topic including the current system of the hotel management where the proponents focused the study. Qualitative data is used by the proponents to gather useful data through the method mentioned in the study. The data gathering is very useful. Without this information the proponents were not able to conceptualize and analyses the proposed system.

Assessing the collected data is important to the research topic. The gathered information will be analyzed. The data to be collected are based on the changes made to the software during development. Development of the system is a designed to provide some insights to the proponents into the system development and lead to better techniques for detections and corrections of errors. Without the organization and people involved in the development, the system cannot acquire such data that is very useful to develop the said proposed system.

Refer to page 57 for the IPO (Input Process Output) diagram.

C. Documentation of Current System

The current system of the hotels in our country are using manual procedure system in keeping records, and in doing hotels related task. In making a check-in transaction the customer must fill-up the reservation form in the front desk of the hotel before proceeding to the cashier for payment. This type of process best applies to walk-in customers only since they have the privilege of looking around the rooms and facilities.

The current system are accepting reservation, by just using telecommunication or phone calls if they are going to reserve on that hotel same process applies but it takes more time because of too many inquiries and questions, and because it is not a face to face transaction some error is expected. The current system have food and beverage department it is the one who responsible of giving the guest good food services.

The housekeeping is the one who will maintain the cleanliness of hotel rooms. The accounting department is the one that is responsible for preparing the financial statements and payroll using manual process, cashier is responsible on guest payment and handle paid-outs. This is an ineffective for the guest and customer because this manual process gives hassle to them and most of the guest wants easy ways where they feel comfortable in reservation and check-ins in the hotel and having a great accommodations being provided.

Refer to page 58 for the current system flowchart diagram.

c. 1 Description of the Current System

In the manual management of the hotels in our country, the data entries are paper-based. Hotel information about the customers who have been check-ins inside are stored on logbooks. Manually working on the hotel related task are consuming more time and effort for the hotel employees. This would often cause hard time in storing and retrieving data and files. It is also requires a lot of time in searching for records that would be needed.

The current system operates manually and it keeps track in signing the customer's information in the logbook. When there are tendency about customers complaining it would take a hard time looking down the records again searching for specific information. The hotel management has two options for the walk in guest who has been going to the hotel on that day for check-in transaction and for the customer who have been using reservation using telecommunication.

The walk-in guest are needed to sign up their information using writing instruments on front desk for their check-ins transactions if they are a walk in guest. The front desk are the one who would be given the information available rooms on the guest depending on the room types. The guest is needed to pay on the cashier depending on the rate of room they have chosen, after the customer has paid the bill. The concierges are the one who would assist the guest on their respective room.

The guest are able to use all the things inside of the room of the hotel they have chosen to stay with. If the guest are needed something, they can use the phone inside the hotel room to call some assistant to help them to make things easier. The hotel management

provided security officers to protect the guest and staff of the hotel, including all their stuff; they take regular rounds inside the hotel.

The hotel management also provides housekeeping to take care of all rooms and to maintain the cleanliness inside the hotel, and also provided room service it is the service of food and drinks in guest rooms in a hotel. The food and beverage department is responsible for maintaining high quality of food and services.

The current hotel reservation, for the customer who has been able to reserve in their respective place, they can use phone call for their reservation transaction. The hotel front desk is the one who making reservation for rooms inside the hotel and for check in transaction of guest. The reservation can be done by a variation of sources such as telephone transactions, and walk in reservation transactions.

In terms of the payment of the customer who want to reserve, the hotel management will not allowing them to transact without down payment but the customer will pay the down payment inside the hotel. The cashier is the one who collect the money from guest for their check-ins accommodations and any other fees during their stay. The hotel management is the one who would be given all their customer/guest fully and trustworthy services.

c. 2 Personnel/ Equipment Used by the Current System

Hotel manager is most of all, as the vital stakeholder of the hotel management, would oversee all operations in hotels, including sales, customer service, maintenance and housekeeping, which includes maids and housekeeping cleaners. In addition, if the hotel has a restaurant, hotel managers will ensure that the food served meets the quality and cleanliness standards for the customers. They are also responsible for building sales and profits in their units by advertising and hosting conventions

Supervisor is the one who monitors and regulates employees in their performance of assigned or delegated task it is also the person who supervises a person or an activity he/she is the one who manage operation in the hotel management.

Administrator is assigned to make changes on a computer that will affect other users of the computer. It can change security settings, install software and hardware, access all the files on the computer, and make changes to other user accounts.

Housekeeping is the one in charge to ensure that the hotel is clean, rooms are clean and guest will return, a housekeeping needed to clean guest rooms, wash bedding and towels, replace toiletries that have been used, and clean other areas of the hotel.

Room service if the hotel is equipped with a kitchen, it often offers room service. Guests who want to eat but don't want to leave the hotel or go to the hotel restaurant can order from a menu in their room. As a room service employee you may be taking room service orders, and then delivering them.

Front desk is the main desk at a hotel, for checking in or out and handling request from guests. Also may include room reservation and assignments, guest registration, cashier work, credit checks, key control as well as mail and message service.

Event planner many hotels have conference rooms, ballrooms, dining halls, or other spaces that they rent out to businesses and individuals for events such as weddings, seminars, and similar occasions. The planer works with a representative from the company or individual to make sure that everything is in place for the event.

Concierges if a guest needs a specific service the guest can contact the concierge, who will coordinate the execution of this service. It is the one who arranging tours and making restaurants reservation for the guest.

Guest/Customer is a person who spends some time at another person's home in some social activity, as a visit, dinner, or party. It is a person who is invited to visit the home of or take part in a function organized by another.

Security officers is the one literally the guest and staff of the hotel there role is to secure the actual locations, and the property of the hotel itself. It is a person who usually use preventative task such as patrolling and investigating inside the hotel.

Hotel owner are individuals or corporate entities that own and operate one or more types of hospitality accommodations. There are a number of different types of hotels, each tailored to attract certain consumers.

d. Data Gathering Procedures

The data gathering techniques or methods that we used in order to have the necessary data about the current system are interview, research and observation. We prepared and formulated questions to be asked on one of the hotel personnel.

We conducted an interview in order to discuss formally and fully understand every detail about the hotel that would give us an idea on how to enhance their current system, interview is a useful method to learn more about the hotel management, and about its employees and on what the process of the current system inside the hotel management. The personnel of the hotel are the one we have reach out about certain questions.

The other method we used is the research method it is the best and common way to know important information and details that we need to use in our proposed system study. We research using internet on some related study that would be useful in working to the proposed system, we look for meaning on some difficult terms that we have familiarizes in order to build the proposed system.

The observation method was also used and one of the important needed on the study. It is help us to identify not just the problem on the conducted interview but the other problem facing on the current system of the hotel management. We use this method to observe the hotel management to be able to identify not just the process but also the equipment's they are using on their daily hotel services transaction.

Planning is one of the methods we used on the study. It is help us to think the process and other requirements to achieve a desire goal to enhance the current system of the hotel management. It is involves the creation and maintenance of a plan.

Chapter 3

REQUIREMENT ANALYSIS SPECIFICATION

The chapter discusses the generalizations about the current system that is being used by hotels nowadays. The explanation being presented in the statement of the problem. This would tackle on the general and specific problems which are encountered in relation to the hotel reservation system. The scope of the chapter also answers the explanation to the objectives of the study. Whether pertaining to its general and specific objectives which are also encountered the current system.

This chapter also presents the results and explains how the data was being gathered and analyzed. It elaborates the processes, procedures and transactions that are performed in the application of the current hotel management system. Then, the overall analysis of the proposed system, discussing what would be the process of the proposed system by the illustration of the flowchart. It would also picture out the outcome of the process to what the system would be provided.

It would also enumerate the software and hardware requirements needed in the development of the proposed system. Human resource complement is also part of the chapter for it is discussed what are the training and skills needed to be able to utilize the system. Additionally, manpower would be needed in order for the system to perform its efficient and convenient operation.

a. Answers and Explanations to the Statement of the Problem

In the previous chapter, after having been able to gather relevant data, we had presented the statement of the problem concerning the current system of the hotel management.

The hotel management had been using a manual process system in doing related works, using writing tools like pens and logbooks in recording the customer's information. In keeping tracks of records from the past years, it requires a hard time for storing data. In that case, there might be a tendency that the stored files might get lost or maybe destroyed. In case of inquiring reservation of room customer are needed to call and wait for a while to be able to know whether the room is available or not. Therefore, the current manual process in the hotel is consuming a lot of time and more hassle.

Problems may possibly be encountered when it comes to current hotel management systems. Especially in the form of the manual process of the department services system that causes inconveniences and delay on the process of hotel services, also hotel management cannot monitor the details of the daily reservation. But in order to solve the problem, we must know its wrongdoings and find specific ways on how we should correct or even improve them.

If the hotel does not develop or improve its hotel system, and continues to do every task in the hotel manually, the hotel would be behind with the arrival of today's technological demands. The hotel would not make use of the modern advantage that the technology have. It would fail to be in line of those other hotels in our country that have already using the computerized hotel management system.

In order to solve the existing problem of hotel we will carry out the procedures that we had presented in the previous chapter of this proposal. Our proposed system will help the hotel management to manage with the ever changing demands brought by today's technology. The proposed study will convert the current manual system of the hotel management into a computerized and user friendly interface.

In this proposed study, we can come up with a good solution on how to solve the problem of the current process of the hotel which manual process into computerized web based management system to performed all task in each hotel department with less time being consumed, and it should be convenience and efficient in order for the hotel personnel to monitor the operation of the hotel, and to give each hotel departments a good, easy and user friendly system to enhance the lack of the hotel management services, and to manage easily and help keeping the records in the hotel departments.

For online reservation the customer will be provided an accurate reliable reservation to make it easy for them to make some reservation online without conflicts on hotel rooms they choose, and SMS notification which will sent to the customer and will notify them if they are successfully reserved on the hotel they have chosen, in the message it will inform the customer, about the bill of payment, types of rooms and time and date of check -ins.

b. Answers and Explanations to the Objectives of the Study

The hotel is using manual process in terms of managing all works inside the hotel. The proponents proposed a system that would enhance their management to provide the customer a good quality and service with regards to the customer reservation and other hotel services. The objective of the study will be accomplished based on the problems presented in the current system.

There are some problems encountered on the hotel management on the current system in making some reservation especially on the customers who have been reserved using phone call reservation, it takes more time because of too many inquiries and questions so there are some tendency that error is expected. The hotel reservation has no exact and consistent reservation, so there are some conflicts for the customers in doing some rooms reservation.

The proponents aim to replace the current manual process of the hotel into a computerized one. To less time being consumed, fasten transaction, organize and secure all the information and records in each department inside the hotel. It will improves the over-all management of the hotel once computerizes system will be used. Through using computerized system, work is done easily provided that only authorized hotel personnel can access the system.

The hotel management will be provided consistent interface in each authorized personnel to make all their transaction secured. Regarding online it will be provided qualified information about the available rooms to allow reservation of the customer without error or conflicts. The reservation of customers can be done faster and easily

without hassle to make reservation. Using this kind of system large amount of data can be stored safely. The transaction will become faster once the said system will be implemented.

The proponents will create a user-friendly interface in each departments inside the hotel management to provide the authorized personnel a convenient way in storing and manipulating data, and to provide an accurate reliable reservation for the customer, to make it easy for the customer to choose excellent qualified information's about the available hotel rooms and accommodations.

The proponents will enforce the security actions to avoid unauthorized access to guest records. The backup of files will be created in every successful transaction. The hotel front desk would receive a notification on the customer who would be able to reserve on the hotel using online reservation; the payment will be done inside the hotel management on the day of guest arrival. A SMS notification will be sent to the customer who has been reserved online to ensure that they are successfully reserved.

c. Results, Explanations, and Analysis of the Data Gathered

In gathering data, the proponents are able to get the result out from it. Based on the study, they found out several problems that encountered in managing the hotel reservation and services. The proponents conducted interview in order to discuss formally and fully understand every detail about the hotel that would give us an idea on how to enhance their current system, we take down notes and gathered all the data needed.

Using paper based system, and recording the information of the customer of the hotel using logbook is a lot of hassle. They cannot ensure the safety of files, because it is prone of losses some customer information. Retrieving of data would take time, because of manual process. The other method used is the research method, using the Internet and to look for some related studies, for us to be guided on how to improve the proposed system study. Through researching, the proponents had gathered significant data and important information that are usable enough for the documentation of our study.

The proponents observed the hotel management in order to know how to improve the current system on reservation using telecommunication it takes more time because of to many inquiries and because of that there are some tendencies of error transaction. Observing help us to identify the other problem facing on the current system of the hotel management. We use this method to observe the hotel management to be able to identify not just the process but also the equipment they are using on their daily hotel services transaction.

The proponents interpreted and analyzed every data that was gathered, using brainstorming it help come up with a good idea and on how to solve the problem, it also

identify and resolve all the possible risks in the system development. The planning method is needed on guiding how to execute the proposed system; it also helps on how to manage the time cost, quality, change risk and issue, it helps also helps the purposes, replacements and limitations of system are determined and documented.

With that, a solution was being proposed to end up the current manual process of the hotel. The proponents formulated the design of the proposed system correctly and gathered information that is used in the study; it aimed to have a fully secured system in order to provide convenience, efficiency, and accuracy of information to all individuals and departments inside the hotel management who are part of the process. It also designed a user friendly interface that helps the customer and authorized personnel in each department inside the management to easily recognize in using the system in every transaction.

d. Over - all Analysis of the Proposed System

The proposed system Web-based Hotel Management and Monitoring System and Online System with Short Messaging Service Notification aims to computerized the hotel management related works and transaction for reservation and other services. It will provide a useful storage of files and important information regarding on the customer who have been check-in on the hotel. The records of the hotel customer's information and other files of the hotel will be secured.

The proposed hotel system will be computerized in terms of managing the whole related hotel management task in each department. The system would provide easy, efficient and convenient storage for all data files in the hotel. It would be help not just for hotel management but also for the hotel personnel in making things easy and doing fast there daily task in terms of hotel operation.

The departments inside the hotel like front desk, cashier, accounting department, maintenance department, human resource department, housekeeping department and food and beverage department will be providing user friendly interface and automated system that will help them to do their daily task faster and easily with less time being consumed.

The front desk inside the hotel will get notification from online reservation of the guest and responsible to entertain the guest who will check in inside the hotel, responsible to handle the extended hours of check-in and the one who inform other departments to give the guest worthy and efficient stay.

The cashier department is responsible on handling payments or bills of guest who reserve online and guest who check-in inside the management. The accounting department

is the one who hold the entire sales of the hotel. The maintenance and housekeeping will receive notification from the front desk regarding of the guest who will need their service

The human resource department is the one who can create or update the accounts of the users in all departments inside the hotel management, the food and beverage department is the one who will give the guest good quality of food, the food and beverage department had own cashier where the guest can pay the food they purchase. The administrator is responsible and the only authorized person to view the reservation online, the status in the hotel management, and update changes.

The hotel will have their own website with a user friendly interface that guest can easily book room through online giving them a more easy way and hassle free reservation. The online reservation system allows the guest to manage and choose the rooms they need, it can help the customer choose good types of accommodations offers by just visiting the required site.

Using online reservation the guest must fill up the required information including full name, address and contact number to have successful transaction, after the reservation an SMS notification will receive to the guest serve as notification of successful reservation.

Refer to pages 59-65 for the flowchart of the proposed system.

e. System Design Specification

The system structures are based on the data gathered by the proponent in order to create a Web-based hotel management system, monitoring and online system with SMS notification. It's for the hotels that are willing to adopt this system, in order to keep the edge on competitors and to make things easier on the customer, and for the hotel management as well.

The proposed system has two sections, one for the hotel management and one for online reservation. The online reservation is connected on the hotel management system, the system are flexible for the hotel management in order to their accommodation and range of services. The customer who are using online can view the deferent kind of hotel accommodations containing what room is available in that day.

The proposed system will included a log-in form. The authorized user will have their particular account, and a unique username and password. The front desk also have access to the hotel system but have a few limits in viewing and editing data, which can only be done by the main administrator. The front desk is the one who can get notification on the customer who will able to reserve online, and the one who handle the guest regarding on their check ins transaction.

In front desk account interface it can be seen all the records of guest who have been check in inside the hotel and also for the types of room available. The cashier account interface it can be seen all the payment records of the guest, the cashier is the one who issued the receipt for the customer.

The accounting is the one who handle the entire sales of the hotel management. The administrator on the other hand, has all access to view the entire system and the only authorized person to view and handle the system, and the one who created, updated the room information in walk in and online reservation.

The human resource department is authorized to create and update account for the users in the departments inside the hotel management hotel including front desk, cashier, accounting departments, housekeeping department, maintenance department, and food and beverage department. All departments inside the hotel management will be provided an automated system to perform for their respective task automatically.

For the system online, the first thing that a user will observe is the homepage interface the customer can also select the room they wanted to reserve and overview the room types, room rates and other services offered on the hotel. The customers must fill-up a form provided within the site like personal details of the customers including full name, address, contact number, email.

The customer must also indicate the date of the reservation, the date and time of check-in and check-out. After reservation transaction of the customers online, a notification message will be sent on the customer's phone number, allowing customers receive a text message confirming that the reservation is successfully made.

Refer to page 50 for the HIPO (Hierarchical Input Process Output) of the proposed system.

f. Hardware Requirements

These will be the possible hardware requirements needed for the implementation of our proposed system:

Computer is a general purpose device that can be programmed to carry out a set of arithmetic or logical operation automatically. Since a sequence of operation can be readily change, the computer can solve more than one kind of problem.

Router is a device that forwards data packets along networks. A router is connected to at least two networks, commonly two LAN's or WAN's or a LAN and its ISP's network. Routers are located at gateways, the place where two or more networks connect.

Payment Terminal also known as a point of sale terminal, credit card terminal, EFTPOS terminal (or a PDQ terminal in the United Kingdom), is a device which interfaces with payment cards to make electronic funds transfer.

Internet means of connecting a computer to any other computer anywhere in the world via dedicated routers and servers. When two computer are connected over the internet, they can send and receive all kinds of information such as text, graphics, voice, video, and computer programs.

g. Software Requirements

The following are the basic software requirements used for developing the proposed system:

Sublime text is a platform source code editor with a Python application programming interface. It natively supports many programming languages, and its functionality can be extended by users with plugins, typically community-built and maintained under free-software licenses.

Xampp (MySQL)-is a free and open source cross platform web server solution stack package developed by apache, consisting mainly of the apache HTTP server, database and interpreters for scripts written in the PHP and Perl programming languages.

Web Browsers is software that is used to access and lets you to visit websites and do activities within them like login, view multimedia and link from site, it is used to navigate the World Wide Web and to view html files.

Adobe Dreamweaver is a software program that serves as a text editor for making codes so as to design web page. For the success of the study, the proponents believe that this software is much usable, because the proposed system is web based and it greatly involves developing and designing web pages.

h. Human Resource Complement

Manpower is needed to administer and manage the entire system. They will be ones working and be responsible for every work that has to be done in the system. For them to know how they should be literate enough in using computers and could easily fix problems in the entire system.

Administrator is the one who manage the important or necessary information and data on the hotel management system, the one who can add, edit, delete and make changes on the content of the system, and the one who will manage the entire system.

Front desk is will be the one who'll always be working with the system since they'll be assigned to the information desk and receive inquiry from the guest/customer inside the hotel. It is the one who ensure that the customer are greeted warmly and checked in efficiently, the one who can monitor all the available rooms, reservation online and all the customer/guest who have been check-ins.

Accounting is the one typically handle a variety of important task such task often include budgeting, payment process and financial report and more.

Housekeeping is responsible for the immaculate care and upkeep of all guest rooms and public spaces. Individuals who excel in our housekeeping departments have an eye for detail and a commitment to the training, development and motivation of a diverse group of talented employees. It is service and cleanliness that really make an impact on our guest and determine whether they will return.

Engineering Department is responsible in repairing and maintaining the plant and machinery, water treatment and distribution, boilers and water heating, sewage treatment, external and common area lightning, fountains and water features and others.

Security is the one who protect the guest and staff of the hotel, including all of their property, the one who role in a hotel to secure the actual places, and property of the hotel itself.

Human Resources Department has to do with administration of an impartial and internal justice system which will promote transparency and openness in organizational communication. It is also serves as a progressive voice in a common system and strives to ensure competitiveness in the conditions of service for staff.

Customer/Guest a person who can make a check-in transaction for their vacation, it the one person who can access the system, in using the online reservation in order to transact reservation in the said day to the hotel management.

Chapter 4

SUMMARY, CONCLUSION, AND RECOMMENDATION

This chapter contains about summary, conclusion and recommendation it discuss the overall result of the study. It includes the reason as to why the researchers thought of coming up with such proposal. This chapter also states the summary of the new system in which the different functions of every department and different account are specified. The discussion also includes the difficulties encountered by the people involved in the current system regarding on their daily transaction.

This chapter also discusses the conclusion for the creation of the proposed system program. It will similarly enumerate the advantages of using the proposed system and to end and finish the process. Lastly, recommendation are also enumerated which included to show that the proposed system is upgrading and revise. It is also a suggestion or proposal as to have the competent system; also a part of this chapter, mentioned the important steps to be considered for the implementation of the system.

a. Summary

The research has brought into development of hotel management system which will cover the daily transaction in each department inside the hotel including online reservation. The study has come up with a computerized system that can easily use by the required personnel to provide a good and fast service to their guest. It would be help not just for the hotel personnel and hotel departments inside the management but also for the hotel staff in making things easy and doing fast there daily task in terms of hotel operation.

The departments inside the hotel including front desk, cashier, accounting department, maintenance department, human resource department, housekeeping department and food and beverage department will be providing user friendly interface and automated system that will help them to do their daily task faster and easily with less time being consumed. The administrator is the one authorized personnel who can update, edit, and delete the entire system.

The hotel will have their own website with a user friendly interface that customer can easily book room through online giving them a more easy way and hassle free reservation. The online reservation system allows the customer to manage and choose the rooms they need, it can help the clients choose good types of accommodations offers by just visiting the required site and will help them to make things easier without hassle. A short messaging service notification shall be sent to the reserved customer for important information regarding on their reservation online.

b. Conclusion and Justification

Based on the findings in the previous chapters, it is concluded that some of the Hotel Management in our establishment are still uses a manual system. It is a time consuming and hassle regarding on their daily transaction. It needs effort and time particularly in the personnel's part regarding on services to the guest. The hotel management has also facing a problem regarding on reservation, it take time for the clients to use phone call reservation because of too many inquiries, and because it is not a face-to-face transaction error is expected.

The researchers came up with the study to provide a solution regarding on the current system, by developing the proposed system. This will decrease the burden of each department inside the management regarding on their daily transaction, and it will help the clients reserving the room easily without consuming of time and the clients can get information regarding on the reservation using short messaging notification.

The proposed system also provides easy, efficient and convenient storage for all data files. It would help the hotel staff in making things easy and doing fast there daily task in terms of hotel operation. The administrator is the only authorized person to view and handle the entire system, and the one who created account for the users in each department inside the hotel management. All departments inside the hotel management provided a user friendly interface that helps all the authorized personnel in each department easily use their user account inside the management.

c. Recommendation

Based on what is stated on the previous chapter, the following recommendations were taken into consideration to make the system fully operational. The Web Based Hotel Management System a Proposed Online System with Short Messaging Notification conducted by the proponents of the study is recommended to be used as it helps encounter the problems in the current system. The proposed system was developed to process fast transaction.

The system implements security actions to avoid unauthorized access to all records, and also to provide accurate and reliable transaction better than the current manual system that the institution is using. To make the system fully operational includes the following recommendations for software and hardware requirements as stated on the third chapter; human resources should also take place.

Using the proposed system still requires a full control of each process, sufficient execution in the operation of users re still required in order avoiding intervals for the proposed system. The use of the proposed system includes visibility of operational transaction in the management and more efficient. Also the proposed system is also capable of upgrading for the future needs which suit the existing and future technology advancement.

c. **Recommendation**

Based on what is stated on the previous chapter, the following recommendations were taken into consideration to make the system fully operational. The Web Based Hotel Management System a Proposed Online System with Short Messaging Notification conducted by the proponents of the study is recommended to be used as it helps encounter the problems in the current system. The proposed system was developed to process fast transaction.

The system implements security actions to avoid unauthorized access to all records, and also to provide accurate and reliable transaction better than the current manual system that the institution is using. To make the system fully operational includes the following recommendations for software and hardware requirements as stated on the third chapter; human resources should also take place.

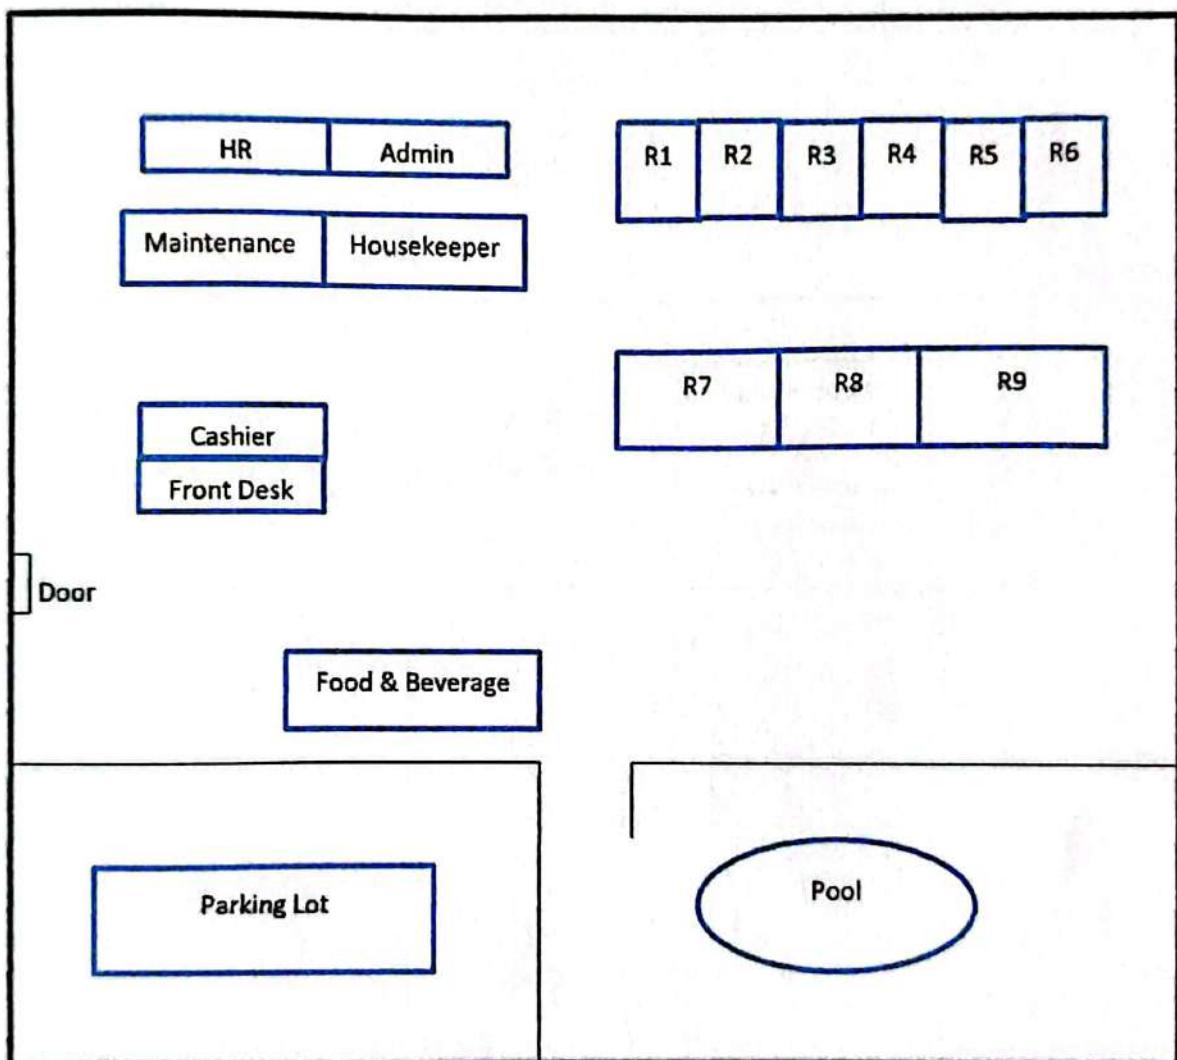

Using the proposed system still requires a full control of each process, sufficient execution in the operation of users re still required in order avoiding intervals for the proposed system. The use of the proposed system includes visibility of operational transaction in the management and more efficient. Also the proposed system is also capable of upgrading for the future needs which suit the existing and future technology advancement.

Letter for Interview

Republic of the Philippines
EASTERN VISAYAS STATE UNIVERSITY – ORMOC CITY CAMPUS
Ormoc City

March 2017

General Manager
 Villa Hotel
 Ormoc City

Sir/Ma'am,

We are fourth year students of Eastern Visayas State University Ormoc City Campus (EVSU-OCC) taking up Bachelor of Science in Information Technology (BSIT). We are writing this letter to express our sincere desire to request a scheduling of our interview in working with the documentation of our thesis proposal study titled “Web-Based Hotel Management and Reservation Monitoring System A Proposed Online System with Short Messaging Service Notification ” with your esteemed company.

We are confident that your expertise and experience are appropriate in guiding us towards the completion of our project. We believed in your skills and potentials in this field. We would be grateful to conduct an interview with you.

We are hoping to receive a favorable response soon on our request. We can be contacted at 09157417994 or 09068820680.

Thank You and God Bless.

Sincerely Yours,

ROVIC D. JONALE
 MARY JOY R. PEPITO
 JOHN NINO C. PENALOSA

Interview Questionnaire

Questionnaire:

1. What is the process in reservation online?
2. Process of online payment?
3. How can you secure or trace if the clients using online is not making fake reservation?
4. If there is a problem regarding on customers arrival on the said day of check in? How can the hotel management handle that problem?
5. How did the clients reserving online know if they are already reserve online?
6. If the customer reserving online arrived in the hotel, how can you identify that he/she is the one reserving online?
7. Who handles the promos & discounts?
8. What is the terms & conditions in online reservation?
9. Did the customer need to give her email address or phone number during online reservation? Why?
10. What is the process of walk – in?
11. What are the departments inside the hotel management? And its functions?
12. Process of walk in payments?
13. If the guest have something to ask? Does the guest need to pay those charges already?
14. Is all the things inside the room covered of the payments of room amenities? Or you need to pay if you use it?
15. Process of walk in payments?
16. Is it possible the clients exceed on the time of their check out? They do need to pay those charges?
17. What is the function of front desk? How many front desks?
18. Is there a cashier inside the hotel management?
19. Is all the amenities inside the hotel package on the hotel rooms?
20. What are the differences of rooms?
21. What information should the customer fill up in terms of check in transaction?
22. Can you tell us about check in time and check out time?

Appendix G

Administrator Interface

This screenshot shows the 'ROOMS' section of the administrator interface. The left sidebar includes links for Dashboard, Rooms, Sales, Amenities, and Guests. The main area has tabs for Home, Amenities, and Add Amenities. It features search fields for Room Number and Room Type, and buttons for Search and Reset. A large orange button labeled 'Add Amenity' is prominent.

This screenshot shows the same 'ROOMS' section as above, but with specific filters applied: 'Room Number' is set to '1002' and 'Room Type' is set to 'Deluxe'. The search results are displayed below the filter inputs.

This screenshot shows the 'GUESTS' section of the administrator interface. The left sidebar has a 'Guests' link. The main area displays a table of guest entries with columns for Date, Room Number, Guest, and Group. The table lists eight entries, each with a green checkmark icon and a 'Details' link.

Date	Room Number	Guest	Group
06/16/2017	1002	John Doe, Smith	Group A
06/16/2017	1004	Alice Brown, Smith	Group B
06/16/2017	1003	Bob Brown, Smith	Group C
06/16/2017	1005	Tom Hanks, Smith	Group D
06/16/2017	1007	Sarah Johnson, Smith	Group E
06/16/2017	1008	David Johnson, Smith	Group F
06/16/2017	1009	Emily Johnson, Smith	Group G
06/16/2017	1010	Mike Johnson, Smith	Group H

Available Rooms

Room Image	Room No.	Rates	Room Type	Floor No.	Action
	101	P1000.00	Standard Single	1st Floor	View Details
	102	P1200.00	Standard Double	1st Floor	View Details

SAMPLE OUTPUT

Room Specification

Room Number: 102
Room Type: Standard Double
Room Floor: 1st Floor
Room Rate: P1300
Room Amenities: Free WiFi, TV, Air Conditioned, Gym

Check-In: Check-Out: Book Now

The screenshot shows a web page from HotelDotCom. At the top, there's a green header bar with the HotelDotCom logo. Below it, a banner features a scenic landscape with a beach and mountains. The main content area has a title "Guest Information" and several input fields for guest details like First Name, Last Name, and Email. At the bottom, there are logos for MasterCard, Discover, American Express, and Visa, indicating accepted payment methods.
